CODEBOOK DISPLAY NOTES

PATH STUDY

YOUTH / PARENT QUESTIONNAIRE DATA WITH WEIGHTS

ICPSR #36498-1002

1. ICPSR customized the display of the variables in this codebook. Most variables contain a frequency table displaying value labels and unweighted counts. Some numeric variables show summary statistics (arithmetic mean, mode, median, minimum, maximum, and standard deviation) instead of a frequency table. The median and mode may not display in the summary statistics if a variable has a very large number of distinct categories or values. These numeric variables do not have value labels for valid data. The third type of variable display does not show either a frequency table or summary statistics. These variables usually fall into one of three categories:
 - A. Character (String) variables: Free text responses have been omitted when there are more than 10 to 15 unique responses.
 - B. Lengthy Categorical variables: Variables with more than 25 valid value labels such as variables that end in “_BRAND” and “_PRODUCT”.
 - C. Identification variables: Variables for which univariate statistics are not meaningful, such as CASEID and PERSONID.
 - D. Design and Weight variables: Variables with many values that are too lengthy to display in the codebook and for which univariate statistics are generally not meaningful.

Unless a variable falls into the above categories of A, C or D, a missing values table will be present if the valid cases have been presented in a frequency table, display summary statistics, or have been suppressed.

2. A variable with the same PATH ID (see description in the Public-Use Files User Guide) can display differently over time as a frequency table, summary statistics, or neither of these in the codebook depending on the range of valid values or the number of valid values or the number of valid cases present for that variable for that wave.
3. Frequencies or summary statistics are not displayed for the valid cases for variables ending in “_C” that ask about “cents” for the cost of a product, or “_IN” that ask about

“inches” for a person’s height. These variables are paired with a preceding variable ending in “_D” (dollars) and “_FT” (feet), respectively. Summary statistics or a frequency table may be displayed for that preceding “_D” or “_FT” variable. Both variables in the pair should be used together to accurately estimate the cost of a product or person's height.

4. Some variables contain lengthy universal lists of values for a particular type of question or section. Examples of this are the “_BRAND” and “_PRODUCT” variables that are in each tobacco type section and the “_AD” variables in the Marketing section. Not all of the values listed in the data file may apply to that type of tobacco or for that particular marketing ad. Frequency tables for these variables have been suppressed in the codebooks.
5. As noted above, the frequency tables of the “_BRAND” and “_PRODUCT” variables have been suppressed in the main section of the codebook. However, the top 20 most frequent responses are provided for each variable, with all other coded responses grouped into a separate category. These condensed frequency tables appear in the appendix of this codebook.
6. Variables ending in “_NN” do not have frequencies or summary statistics displayed for valid cases because the valid values correspond to different units. The “_NN” variables are paired with variables ending in “_UN” that specify the units used in the “_NN” responses. For an example see variables R01_AC1009_NN and R01_AC1009_UN.
7. The questionnaire contains numerous boxes of information that precede certain sections or individual variables. When utilizing this codebook, users should refer to the questionnaire and pay special attention to the content of these boxes. Using the questionnaire side by side with the codebook when reviewing the content will help in understanding the information in the data file. The question text of the first variable directly after one of these “boxes” contains the text from the box or a reference to that box. Boxes containing descriptive text are repeated. Boxes containing programming information for system routing variables are referenced. The text or reference following that information for the first variable also applies to the remaining variables in that questionnaire section.
8. In multiple sections of the interview, the order of a series of questions is automatically randomized for the respondent. Information about the order of randomization is

included in the variables containing “_RANDOM_” in the variable name. Cases coded as “-1” indicate that the question was not applicable to the respondent and was skipped during the interview.

9. Users should consult Table 1 and Table 2 in the front of the questionnaire for specific variables that have been removed entirely from or revised in this public-use version of the data.
10. The codebook provides frequency tables for valid and missing values. The displayed percentages are rounded to one decimal place. Due to rounding, not all individual percentages in the sub-tables sum exactly to the total. Likewise, the total percentages when combined may not sum to 100%.
11. Each variable contains the following statement:

“This variable has XXXXX valid cases out of XXXXX total cases.”

This statement describes how many valid cases for a variable were used for the calculation of percents for the frequency tables and in the calculations for summary statistics for continuous variables. Users can also quickly understand the amount of missing data for a particular variable. All percents and summary statistics are unweighted.
12. Data may be missing for a multitude of reasons. The codebook contains a statement as the last piece of information in the display of a variable that lists all user-defined missing values assigned to that variable. Most variables will contain four user-defined missing values. For these variables, the codebook will display, “(Range of) Missing Values: -9, -8, -7, -1”. Some variables may contain additional negative numbers assigned as missing values. The (Range of . . .) statement will not display for any variable where missing values are not assigned, such as CASEID, PERSONID, and weight variables.
13. Users should consult Section 6.7 of the Public-Use Files User Guide for further information about Missing Values. As with numeric variables, character (string) variables contain numerical values to signify why a case is missing but these values are not labeled. All missing values still correspond to the descriptions listed in the following table

PATH Study Missing Value Codes and Their Descriptions

Value	Definition	Applicable data types	Applicable variable types	Description
-1	Inapplicable	Numeric, Character	Interview	This value is coded to identify items that were validly skipped on a route specific to a respondent.
-5	Improbable response removed	Numeric	Interview	This value is coded to represent improbable numeric answers provided by respondents.
-6	Unassigned PERSONID	Character	Interview	This value is coded when a new person is added as a spouse or other guardian in parent interviews for Wave 2 and beyond.
-7	Refused	Numeric, Character	Interview	This value is coded when respondents answered a question as "Refused."
-8	Don't know	Numeric, Character	Interview	This value is coded when respondents answered a question as "Don't know."
-9	Missing – Not ascertained	Numeric, Character	Interview	This value is coded when data were supposed to be collected on a route specific to a respondent but the collection did not occur due to a skip error in the instrument.
-99933	Missing due to respondent not being in previous wave	Numeric, Character	Derived	This value is coded when a value in a derived variable is missing because a respondent did not participate in an interview in the previous wave.
-99999	Missing due to data not ascertained on one or more component variables	Numeric, Character	Derived	This value is coded when a value in a derived variable is missing because data were "Not ascertained" (as described above) in one or more component variables.
-99988	Missing due to a don't know response on one or more component variables	Numeric, Character	Derived	This value is coded when a value in a derived variable is missing due to a "Don't know" response in one or more component variables and none of those variables were "Not ascertained" (as described above).
-99977	Missing due to a refused response on one or more component variables	Numeric, Character	Derived	This value is coded when a value in a derived variable is missing due to a "Refused" response in one or more component variables and none of those variables were missing due to a "Don't know" response or because they were "Not ascertained" (as described above).
-99955	Missing due to an improbable response on one or more component variables	Numeric	Derived	This value is coded when a value in a derived variable is missing due to an improbable response in one or more component variables and none of those variables were missing due to "Don't know" or "Refused" responses or because they were "Not ascertained" (as described above).

-99966	Missing due to missing data on a prior wave for one or more component variables	Numeric, Character	Derived	This value is coded when a value in a derived variable is missing because of missing data in one or more component variables from any previous wave and none of those variables were missing due to “Don’t know” or “Refused” responses, because they were “Not ascertained,” or because of an improbable response (as described above).
-99911	Missing due to an instrument skip pattern for one or more component variables	Numeric, Character	Derived	This value is coded when a value in a derived variable is missing due to items that are not applicable/validly skipped for a respondent in one or more component variables and none of those variables were missing due to the other reasons listed above.
-97777	Missing due to data removed per respondent request	Numeric, Character	Interview, Derived	This value is coded when respondents request data removal.

Population Assessment of Tobacco and Health (PATH) Study [United States] Public-Use Files

Variable Description and Frequencies

Note: Frequencies displayed for the variables are not weighted. They are purely descriptive and may not be representative of the study population. Please review any sampling or weighting information available with the study.

Summary statistics (minimum, maximum, mean, median, and standard deviation) may not be available for every variable in the codebook. Conversely, a listing of frequencies in table format may not be present for every variable in the codebook either. However, all variables in the dataset are present and display sufficient information about each variable. These decisions are made intentionally and are at the discretion of the archive producing this codebook.

R01_YE1001: Ever seen or heard of an e-cigarette before this study

[BOX R01_YET01 - The next questions are about electronic cigarettes, often called e-cigarettes. E-cigarettes look like regular cigarettes, but are battery powered and produce vapor instead of smoke. There are many types of e-cigarettes. Some common brands include NJOY, Blu, and Smoking Everywhere.

E-cigarettes can be bought as one-time, disposable products, or can be bought as re-usable kits with a cartridge. Some people refill their own cartridges with nicotine fluid, sometimes called "e-juice" or "e-liquid". Disposable e-cigarettes, e-cigarette cartridges, and e-liquid come in many different flavors and nicotine concentrations.]

[BOX R01_YD3: The next questions ask about another type of tobacco called dissolvable tobacco. You don't smoke dissolvable tobacco products - they are made of finely ground flavored tobacco that dissolves in your mouth. Dissolvable tobacco products come in a variety of shapes, including small round pellets, thin sticks and flat strips. Some common brands are Ariva, Stonewall, or Camel Orbs, Sticks or Strips.]
